

Take Command of Electronic Access Control with Sargent

SARGENT access control products provide a broad selection of the latest technologies and features backed by ANSI/BHMA Grade 1 mechanical hardware, integrated in attractive, sleek, architecturally-pleasing designs. Sargent access control products are available in wireless, online and offline versions:

Integrated Wiegand Products

These products fully integrate with open architecture Wiegand-compatible access control systems. They are connected via hardware to the access control system, and offer centralized control of all networked locks with the system.

Intelligent Wireless (WiFi) Products

WiFi Technology provides the means for communication between the lock and the access control panel. Faster installation and a significant labor reduction are two of the benefits of using these products. Plus, because no wire needs to be pulled to the door, hard to secure locations are no problem.

SARGENT's Electric Latch Retraction (ELR) exit device is the perfect choice for high traffic egress doors that require access control. This non-handed exit device rail is durable and easy to install. Once retracted, the door functions in a push/pull manner and delivers quiet, smooth operation.
